Supplementary file 12. Narrative social quality of life outcome data not contributing to meta-analyses

Study ID	Number of overall study participants	Time point (weeks)	Measure used[1]	Narrative data comparing change in social impact scores between quitters and non-quitters	Between group difference (↑ social impact outcomes improved more in quitters than non-quitters; ↔ equivocal; ↓ social impact outcomes improved less in quitters than non-quitters
Aversa 2013	943	78	VR-36 (social functioning subscale)	"The three-way PA x Time x PCL-M cluster scores interactions were not statistically significant predictors of any of the VR-36 subscales. The two-way interaction terms were also nonsignificant for the models using Physical Functioning, Role-Physical, Bodily Pain, and Social Functioning subscales as outcome variables."	↔
